Xenasmatella ardosiaca

Figures 1–8

Corticium ardosiacum Bourdot & Galzin 1928 [1 : 234] ≡ *Phlebiella ardosiaca* (Bourdot & Galzin) K.H. Larss. & Hjortstam 1987 [2 : 316] ≡ *Xenasmatella ardosiaca* (Bourdot & Galzin) Stalpers 1996 [3 : 37]

— Sensu auct. pl. → *Xenasmatella decipiens* Hjortstam & Ryvarden

Basidiome effused, adherent, encrusting, more or less ceraceous, up to 50 (80) µm thick, often becoming somewhat corneous when dried, sometimes with short fertile threads about 0.05 (0.1) mm thick running here and there over the hymenium.

Hymenium finely reticulate and discontinuous to smooth and continuous, variable in colour from light grey to light bluish grey or cream to light ochre, often more or less distinctly bicoloured.

Margin indistinct, indefinitely to shortly thinning out, sometimes determinate and abrupt, concolorous with the hymenial surface.

Hyphal system monomitic, all hyphae fibulate but clamps very difficult to observe. Hyphae irregular, richly branched, (0.5) 1–2.5 (3) µm in diam., thin-walled, hyaline.

Cystidia absent.

Basidia pleural, broadly clavate to cylindrical, 11–16 (22)×5.5–7 (8) µm; 4 sterigmata 5–8 µm long.

Basidiospores ellipsoid to broadly ellipsoid in lateral and frontal face, globose in polar face, (3.5) 4–6 (6.5)×3.2–5 µm, Q = 1.1–1.3 (1.4), asperulate to echinulate, with thickening to thick wall, hyaline; aculei blunt, up to 0.4 (0.8) µm long.

Chemical reactions: CB–; IKI–

Incrustation: often with small to large rhomboidal or prismatic crystals.
